

IMPORTANT

1. DO NOT FORGET TO RECORD YOUR SCREEN
2. USE OF AI TOOLS OR ANY OTHER AIDS NOT ALLOWED

Grade 3:

Use the entry ticket as the base and make the following changes:

- When the user adds a new item to the shopping list, also read the price of the item and how many of that item to buy.
- After all the information about an item (name, price, *count*) has been entered the total price for that item shall be calculated ($\text{price} * \text{count}$) and added to a variable keeping track of the total cost of all items combined.
- When the user selects the third option from the menu indicating that they are finished with adding more items, the total cost for all items combined shall be printed to the screen together with the final shopping list.
- Use **two decimal places** and the format below when printing the total cost:

Total cost: 500.**00** SEK

NOTE: The new information read from the user (price and *count*) shall **not** be added to the string containing all the items on the shopping list.

Grade 4:

After passing all the automated tests for grade 3, continue by adding the following functionality:

- Add a variable to keep track of the total number of units added to the shopping list. The variable shall be updated by *count* each time the user adds a new item.
- Extend the new output added in Grade 3 to also include information about the total number of units on the shopping list. Use the following format:

Total cost: 500.00 SEK
Units: 4

- The alignment of the colons is important, format the text *Units* to have a **minimum width of 10** and to be left aligned.

Grade 5:

After passing all the automated tests for Grade 4, continue by adding the following functionality:

- Update the script to keep track of the items with the lowest and the highest cost per unit.
- Calculate the average cost per unit as the total cost divided by the total number of units.
- Extend the new output added in Grade 4 to also include some basic information about the prices. The information shall include the cost of the item with the lowest cost per unit, the cost of the item with the highest cost per unit, and the average cost per unit.
- Use **two decimal places** for all the prices and the following format when printing the information:

Total cost: 500.00 SEK

Units : 4

Price info: 49.50 (Low) / 250.00 (High) / 125.00 (Average) SEK
