

IMPORTANT

1. DO NOT FORGET TO RECORD YOUR SCREEN
2. USE OF AI TOOLS OR ANY OTHER AIDS NOT ALLOWED

Grade 3:

Use the entry ticket as the base and make the following changes:

- When the user adds a new item to the shopping list, they shall also be asked to enter how many of that item to buy.
- The name of the new item shall be combined with how many of that item to buy into a new string before being added to the string containing all items on the shopping list.
- The combined string shall follow the following format:

Milk x 5

The **name** of the item shall have a minimum width of 10 and be left aligned, and **how many of that item** to buy shall have a minimum width of 9 and be right aligned.

- The name and number of items shall be separated by an **x**.

NOTE: As the combined string is the one added to the shopping list string, the same format will be used both when printing the currently added items and when printing the final shopping list.

Grade 4:

After passing all the automated tests for grade 3, continue by adding the following functionality:

- Change how the menu option **Add an item** works by introducing a restriction on how many of each item the user can add to the shopping list.
- The user shall not be allowed to add less than one or more than 99 of an item. If they try they shall be met with the following error message:

ERROR: You must buy at least 1 but not more than 99 of an item. Try again!

- A loop shall be used to make sure the user is asked over and over again for how many of an item to add to the shopping list until they enters a number in the range 1 – 99 (both inclusive).
- After a valid number has been entered and the item added to the shopping list, the user shall be returned to the menu.

Grade 5:

After passing all the automated tests for Grade 4, continue by adding the following functionality:

- Add a counter keeping track of the total number of times the user fails to give a number in the valid range (1 – 99) when trying to add a new item.
- Each invalid input shall result in an increase of the counter. For example, adding “Milk” to the shopping list and first specifying to buy -10, then 200, and finally 3 milk cartons shall result in the counter being increased by 2.
- The **total number of failed inputs**, for all items added, shall be displayed as the very last line when finalizing the shopping list.
- The output shall use the following format:

You gave a number outside the valid range a total of **2** time(s)
